Ansoft was able to fulfill this objective with a single module based on the SWIG scripting language . The approach was adopted by other organizations as well . Siemens produced a 30 MHz radio frequency (RF) analysis system called ScanMax . X-SCAN is a software based RF engineering platform which is developed and maintained by the ETS group. It is the 3D RF tool that is typically installed in the workstation of a designer or technician. The X-SCAN RF engineering platform enables RF engineers and technicians to create and run simulations as well as perform measurements to analyze the RF propagation environment of a specific scenario.
